West Nile Virus Risk Assessment

St. Louis Encephalitis Virus Risk Assessment

Risk Assessments courtesy of VectorSurf.org. Mosquito abundance, environmental factors (temperature and rainfall), number of infected mosquito samples, number of dead birds, and number of human cases are scored and averaged by region.

West Nile virus mosquito samples

5-year average 2023

St. Louis Encephalitis virus samples

5-year average 2023

Abundance of CO₂ and gravid traps for female *Culex* mosquitoes (vectors of WNV and SLEV). District-wide numbers are about the same as the 5-year average for the first half of November (31 mosquitoes per trap). Rural mosquito traps are a little lower than the 5-year average for the first half of November (70 mosquitoes per trap). Urban traps this week are a little higher than the 5-year average (10 mosquitoes per trap; excludes Bubbling Wells).

*District-wide and rural are on 1/2 month; Urban are weekly comparisons

Number of female *Aedes aegypti* per trap

Five-year average includes 2018-2022. This includes years when mosquito detections were lower (2018). 2019 and 2020 included increased detections including new cities and communities.

This week's average was approximately 2 mosquitoes per trap; last year's was approximately 1 mosquito per trap.
